

Project Submission: FirstPlug® Screw Channel Barrier

Agency: Andrew Bowen Designs

Client: 35Newtons

Problem

With dental implant restorations there's long been an issue in later removing the hardening resin and gaining access to the abutment screw for cleaning, replacement, or address infections.

Material Solution

FirstPlug® is a patented medical grade PTFE material specifically engineered to be placed into the screw channel of implant restorations. FirstPlug® is biocompatible, impervious to bacteria growth, expunges moisture, packable, and made in the USA.

Screw Guard

Biocompatible

Antimicrobial

Packable

Hydrophobic

How it Works

After the implant body is seated, secure, and dried with an air syringe FirstPlug® is packed into the channel creating a barrier over the abutment screw. Any excess material is then trimmed and the cavity dried. Completing the process filler is then applied over FirstPlug®
