

# Enjoy the Life

## Field

Architecture Design; Product Design; Material Design; UX Design; Service Design

## Brief

According to the research, as the economic development in most areas of Africa is **extremely poor**, many people live somewhere too bad to confirm the health, especially in some remote areas. Besides that, they **do not classify living areas clearly**; thus, it causes many healthy problems such as infectious diseases are widely spread. This group of modular buildings design and service design helps Africans who lived in remote original villages to **have a better living environment to keep convenient, cleaning, and healthy life**

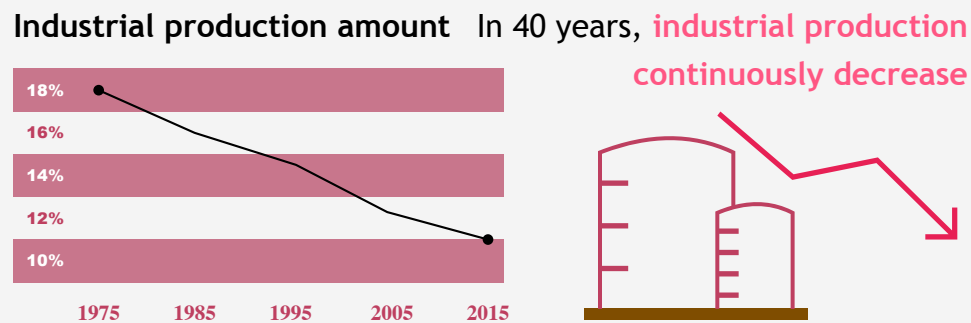

## Background Information

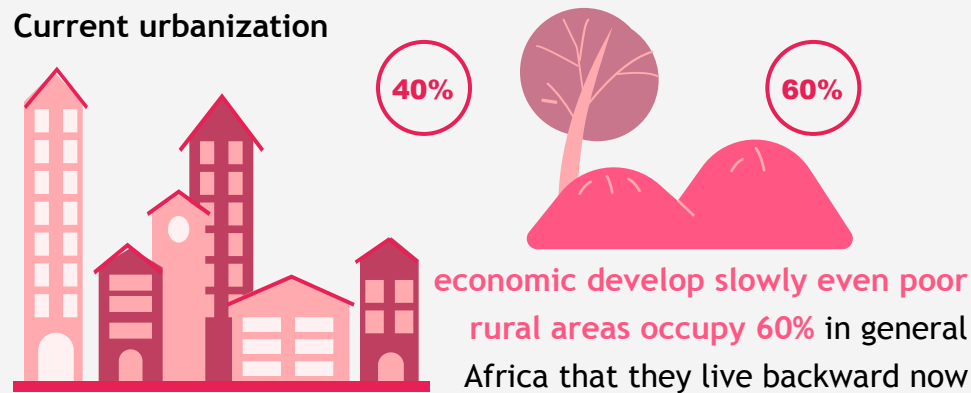

### Current villages in Africa

### Economic development is slow

### Current urbanization

## Demanding Background

### Case analysis

In Africa, people's **living conditions are very bad**. Especially in rural area, it almost like primitive society as the economic is poor

Children malnutrition

Schistosomiasis

Food shortage

Poor housing condition

### Question raised

Many healthy problems **especially infectious diseases** are widely spread in Africa

Yellow fever	Cholera	Pestis
Malaria	Dengue	Ebola virus
Biharziasis	Hepatitis B	...

Disease spread in Africa

### Reason analysis

There have **not clean and high quality of facilities** which are also because of they are hardly to support them

Most of them are **unprocessed materials** to build living areas so they cannot **protect health and safety well**

## Defining the Product

### Product objective

I divide **functional improvements of the house** because it is mostly and directly related to people's lives as a pointcut

### Interview of user demands

I interviewed my **African American friends** to get more local information as **they know more** about their hometowns than me

#### Rondell Romeo

Student live and study in New York now and originally came from Ghana

- Knowledge of dwellings of inhabitants**  
“I’ve ever gone to rural area in my original city one time. Also, I usually read news of exploring African village life.”
- Original lived way**  
“In rural area, they mostly live as group community included someone dwells with their family members.”
- What do you think need to improve?**  
“Living place is simple and crude even many built with branches and grass; clean water is also severe problem.”
- How would you improve their living areas?**  
“Firstly, I need large amount of money. Then, I want to design a modern appearance of house could be cleaner than before. Moreover, I need more pipes to run the water to the home to keep their healthy safety.”

#### Jeremiah August

African American studies and works in New York currently

- Knowledge of dwellings of original**  
“Although I have never come back to Uganda, I know some basic problems of village life in that place.”
- Original lived way**  
“Most of them live with family members and several houses separately located in that area and usually have group acitivities.”
- What do you think need to improve?**  
“The environment is poor and disease spread in Africa. And clean water and modern medicine should be solved.”
- How would you improve their living areas?**  
“I want to solve healthy safety of people to prevent spread of disease. For example, setting different using areas in that location such as living, cleaning and drinking so everyone has not close contact and keep health.”

## Specific analysis

Generally they live at the primitively rural areas in Africa **do not classify clearly** in their lives that even everything **just work together**

Dry rural area

Live with livestock

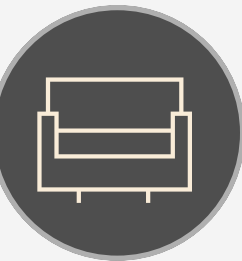

Living and cooking together

Poor sanitation

## Pain points summary

Currently Africans in rural area **only have two community plate**

### Living area

Sleeping

Cooking

Feeding

### Public area

Walking

Enjoying

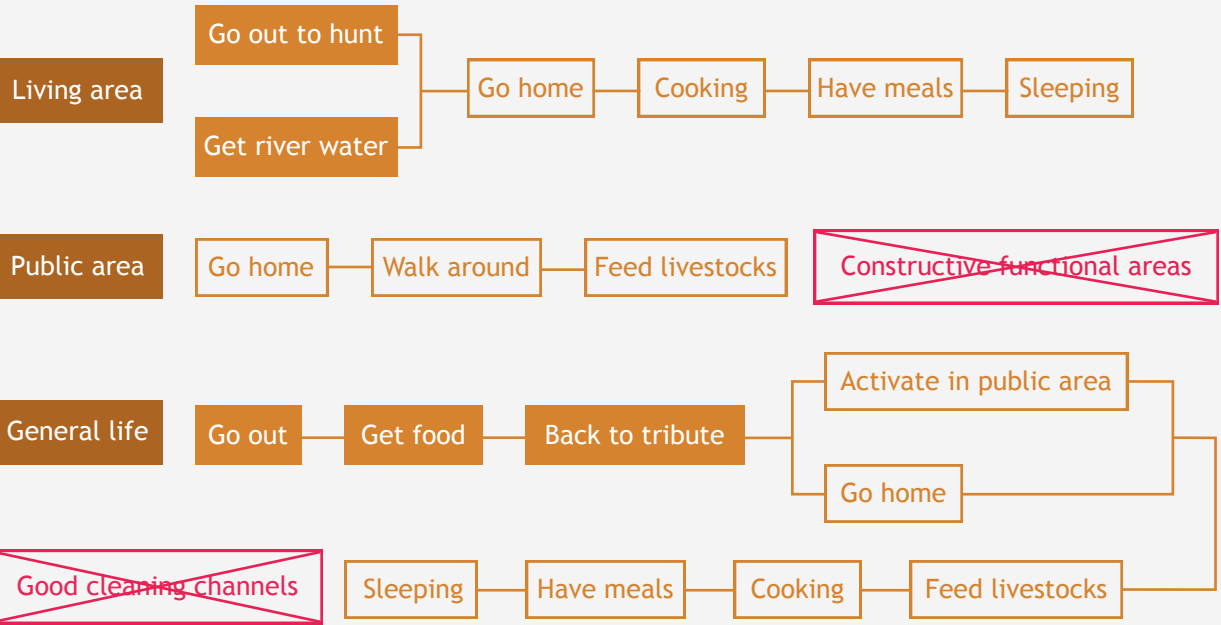

Feeding

Their current living plates could be classified into just **“living area”** and **“public area”**. Besides that, they do many activities mixed in **only plates** so their **health and saftey are under the great threat**

## User flow

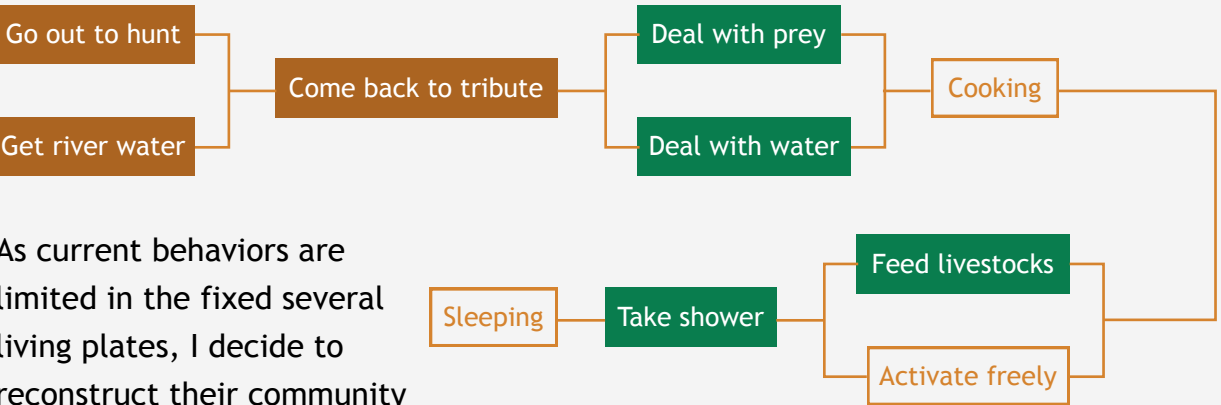

### Current situation

I split their plates to **analyze the pain points** through every situation they would meet to find **how to improve on the certain contacting points** to solve their problems

Africans’ life almost **mixes all kinds of works** in only living plates. The most serious problems are **loss of constructive functional areas** and **origins of cleaning habits**

### Expectable user flow

As current behaviors are limited in the fixed several living plates, I decide to reconstruct their community

## User journey

### As-is user journey

If we improve **the service design** of community, the experience of lives would get a higher equality. I analyze them according to the **As-is** and the **To-be user journey**

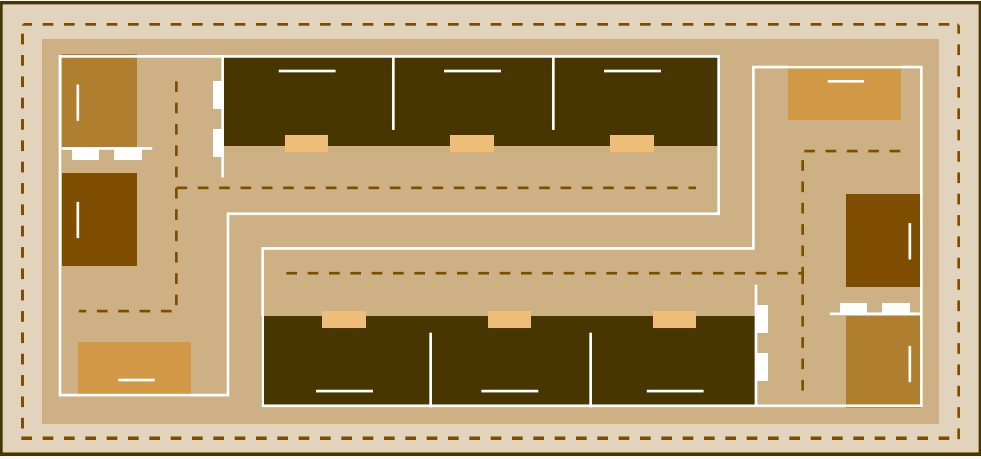

### To-be user journey

## Design objective

Living room Water room Shower room  
Cooking area Feeding room Walking space

“Enjoy the Life” includes 4 different functional areas. And every 3 families share a group of feeding, watering, and showering rooms

**Simple**  
Satisfy daily needs  
Effective layout

**Clean**  
Strengthen the  
cleaning facility

**Healthy**  
Classify functional  
areas & Include  
rooms to clean

## The regional test

As I tested the community layout with boxes to mock the building, it is highly possible to move easily and set them near the river

## Develop Product

### Design direction

I referenced many living constructs to find the suitable structures to build the community for human and livestock. The key points are “easy to move and to build”

■ Give various living space and zoning

■ Convenient to carry

■ Easy to restore and tidy when moving

■ Strong and stable

■ Easy to build and assemble

■ Provide space of breathing for animals

The building lived by humen is inspired by container building convinient to be built and moved

Combining with Dai Tulou in China, a hollow cylindrical building in rural area

Stretched from two sides and round into a hollow building

Livestocks' space stretches flexibly so easily to move and people can choose to build it everywhere

But single piece of tablet is shaky so I reference interspersed structure of blocks

The interspersed structure of building blocks to livestock

## Material research

I tried to find the most suitable materials to build the architectures in communities that let inhabitants more convinient to construct and I used them to experiment to test whether it could be worked on building

Coconut

Cotton

Corn

Pineapple

Peanut

Palm

**Cannot live without it**  
“In Uganda in Africa, banana is one of the main meals to people even they always host visitors with bananas,”

**Source of staple food**  
“Africans often eat starch as staple food and they get it mostly from cassava; also, it is one of the main crops ”

**The main crop**  
“Occupies 90% of cultivation in Africa especially in Mauritius and it is pillar of economy to people ”

**Africa is the hometown**  
“The largest coffee producer in the world is in Ethiopia in Africa that here is perfect environment for it ”

### Development trend

Add demands of “green architecture”  
Decrease the emission of carbon dioxide

### Modular Building

Modular construction (called “box building” buildings are expected to rise 6% globally by 2022

**Why modular**  
Modular building is highly suitable to current concepts of “green” and “sustainable” and has infinite space for people to search its possibility

Cost	Effective
Green issue	Trend

1st testing of modular “Dymaxion House” (1930s)

These modular materials were delivered to U.S. military in World War II

But Dymaxion was lack of budget. So the original plan cannot be achieved

Thus, we completely have possibility to create new materials as the trend in the world and many people have started

These building was constructed by “Cemesto”. It is a new material made from sugarcane

# Material experiments & testings

I tried many experiments to find whether **something new could be used** to build that referenced from **what Africa abound with**. Thus, it may develop in future

## Group 1 Banana 10g, tapioca starch 20g

1 Bake dried banana peels

2 Mash dried banan peels

3 Pour tapioca starch

4 Add water to mix them

5 Boil with large fire

6 Boil until becomes paste

7 Check every 20min

8 Cool it after baking

## Group 2 Sugar 15g, agar 10g, biochar 60g , calcium propionate 3g

1 Prepare 3 groups materials: sugar, agar, biochar and calcium propionate separately mix with water

2 Boil sugar water and agar water with heavy fire

3 Add biochar and calcium propionate as bubbling

4 Cool it as 2nd bubbling

## Group 3 Tapioca starch 15g, sodium bicarbonate 10g

1 Boil the tapioca and sodiumbicarbonate mixture with heavy fire

2 Cool it about 5min

3 Bake with 150 degree and check every 20min

4 Put out when it is matte

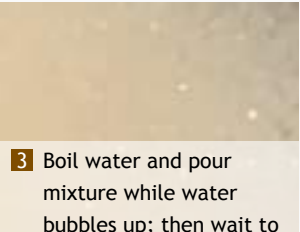

## Group 4 Eggshell 10g, gelatin 5g

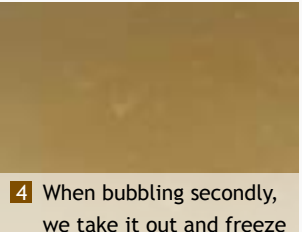

1 Collect some eggshells

2 Pour some gelatin with it together; gelain occupies 1/2 of eggshells

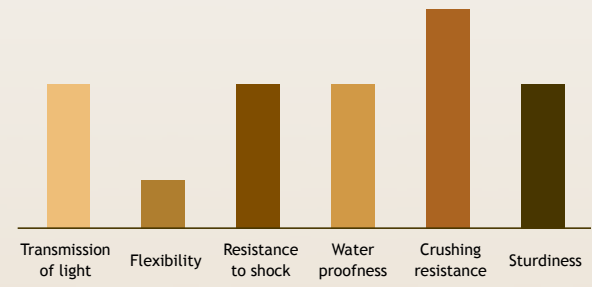

3 Boil water and pour mixture while water bubbles up; then wait to the second bubbling

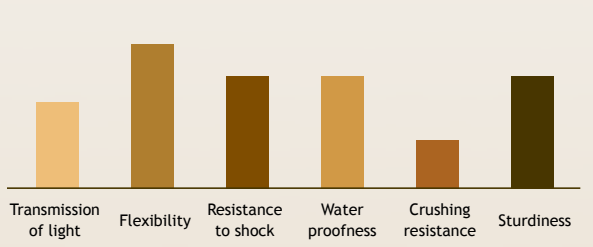

4 When bubbling secondly, we take it out and freeze for 2 hours and cool it

Then, I researched some properties of architectural materials must have and used the certain tools and ask student to help testing whether materials **satisfy properties**

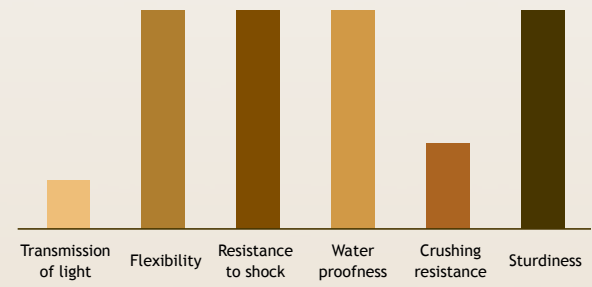

### Group 1 Banana, tapioca starch

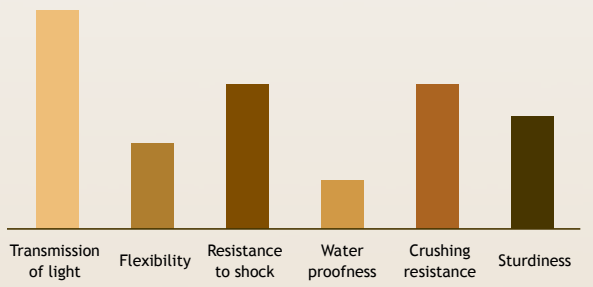

### Group 2 Sugar, agar, biochar, calcium propionate

### Group 3 Tapioca starch, sodium bicarbonate

### Group 4 Gelatin, eggshell

After testings, I found that **Group 3** is the most suitable material to be used in architectural building development which have **general good properties**. Thus, it could **be expected to** be adpated in local architectural materials with more specific testings

Transmission of light			
Group 1	Group 2	Group 3	Group 4
			
Edges is becoming slightly transparent	Texture is not impacted by light	Texture and color have not changed	Most of it become transparent
<div><div></div><div></div><div></div><div></div><div></div><div></div><div></div></div>	<div><div></div><div></div><div></div><div></div><div></div><div></div><div></div></div>	<div><div></div><div></div><div></div><div></div><div></div><div></div><div></div></div>	<div><div></div><div></div><div></div><div></div><div></div><div></div><div></div></div>

Flexibility			
Group 1	Group 2	Group 3	Group 4
			
Broken by dragged in 2 seconds	People cannot break by dragging	People cannot break by dragging	Some debris will be dragged out
<div><div></div><div></div><div></div><div></div><div></div><div></div><div></div></div>	<div><div></div><div></div><div></div><div></div><div></div><div></div><div></div></div>	<div><div></div><div></div><div></div><div></div><div></div><div></div><div></div></div>	<div><div></div><div></div><div></div><div></div><div></div><div></div><div></div></div>

Resistance to shock			
Group 1	Group 2	Group 3	Group 4
			
Intact although dropping from air	Intact although dropping from air	Intact although dropping from air	Part of it is broken when dropping
<div><div></div><div></div><div></div><div></div><div></div><div></div><div></div></div>	<div><div></div><div></div><div></div><div></div><div></div><div></div><div></div></div>	<div><div></div><div></div><div></div><div></div><div></div><div></div><div></div></div>	<div><div></div><div></div><div></div><div></div><div></div><div></div><div></div></div>

Waterproofness			
Group 1	Group 2	Group 3	Group 4
			
Little bit of banana peels separate	Debris keep desintegrating	Material has not changed at all	Eggshell debris desintegrate strongly
<div><div></div><div></div><div></div><div></div><div></div><div></div><div></div></div>	<div><div></div><div></div><div></div><div></div><div></div><div></div><div></div></div>	<div><div></div><div></div><div></div><div></div><div></div><div></div><div></div></div>	<div><div></div><div></div><div></div><div></div><div></div><div></div><div></div></div>

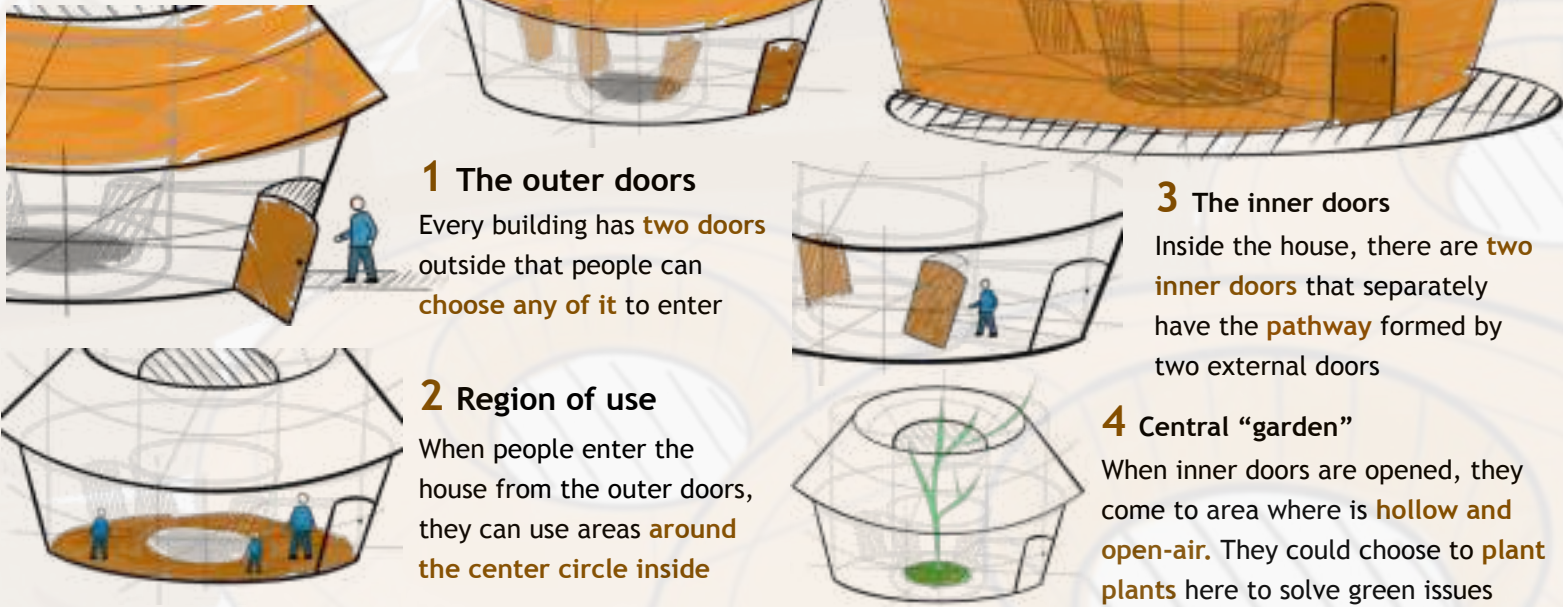

Crushing resistance			
Group 1	Group 2	Group 3	Group 4
			
Not influenced by beating with stick	Broken after beating three times	Slightly broken after stick beating	Not influenced by beating with stick
<div><div></div><div></div><div></div><div></div><div></div><div></div><div></div></div>	<div><div></div><div></div><div></div><div></div><div></div><div></div><div></div></div>	<div><div></div><div></div><div></div><div></div><div></div><div></div><div></div></div>	<div><div></div><div></div><div></div><div></div><div></div><div></div><div></div></div>

Sturdiness			
Group 1	Group 2	Group 3	Group 4
			
No deformation while sitting on it	No deformation while sitting on it	No deformation while sitting on it	No deformation while sitting on it
<div><div></div><div></div><div></div><div></div><div></div><div></div><div></div></div>	<div><div></div><div></div><div></div><div></div><div></div><div></div><div></div></div>	<div><div></div><div></div><div></div><div></div><div></div><div></div><div></div></div>	<div><div></div><div></div><div></div><div></div><div></div><div></div><div></div></div>

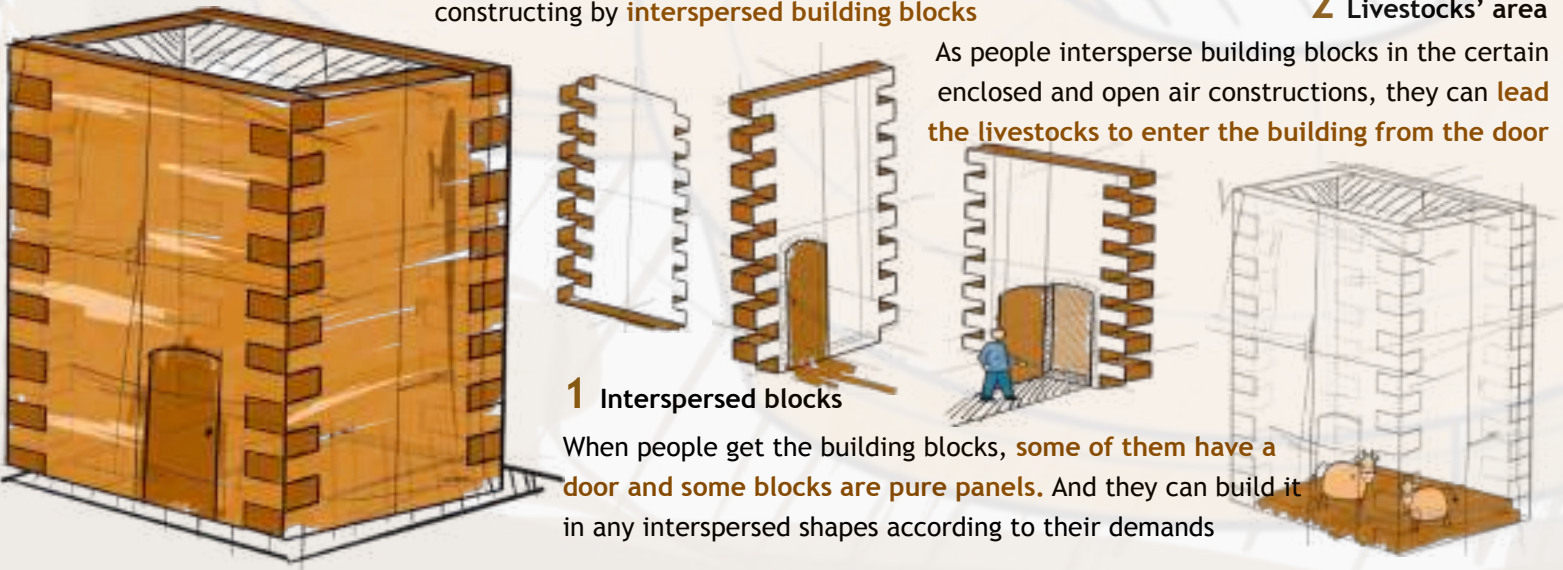

## Function points

### Building lived by people

People's house is a **hollow and toroidal** constructure after residents stretching and turning in a circle

**Building lived by livestock** Livestocks' house is an **open cube** with people constructing by **interspersed building blocks**

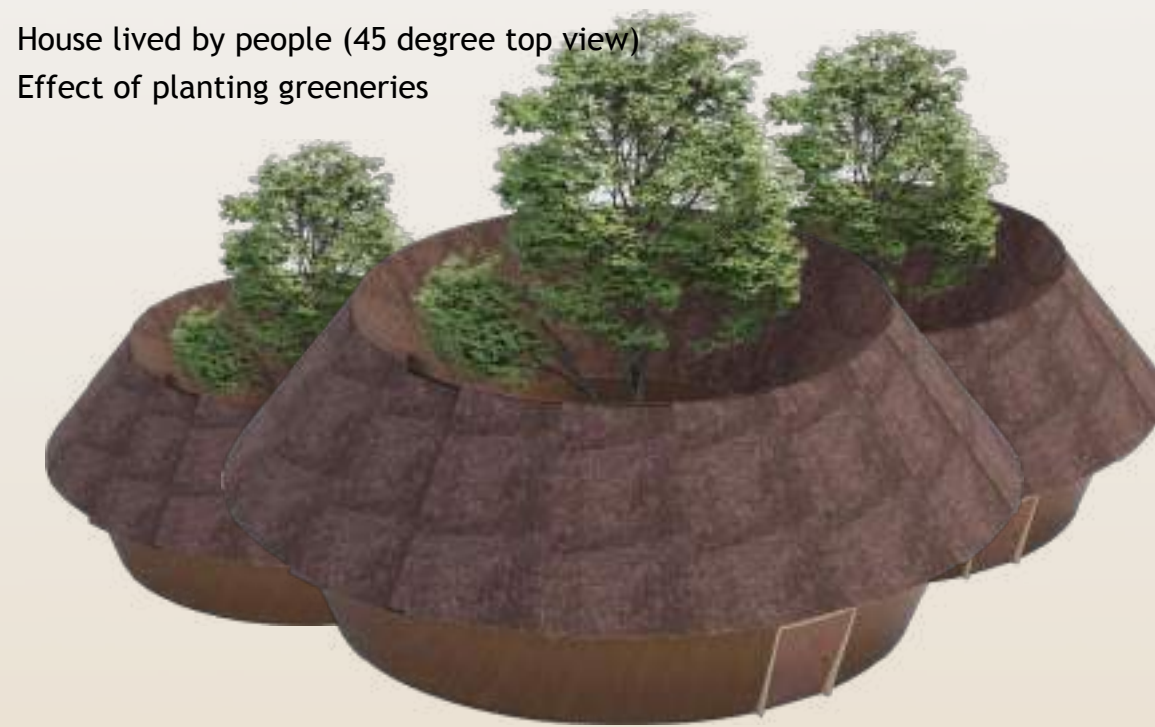

## Final design

House lived by people  
(front view)

House lived by people (45 degree top view)  
Effect of planting greeneries

House lived by livestock  
(30 degree top view)

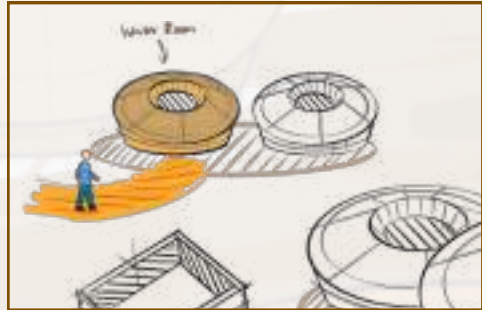

House lived by livestock (45 degree top view)  
Effect of raising livestock

These services mainly pay attention on daily specific living demands to solve the cleaning and healthy problems. Thus, people can decide how to use or sequence of using every area **according to their different situations**

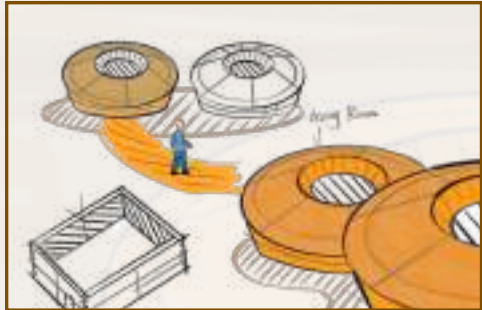

### Water room

When people go outside then come back, they can go to the **water room**

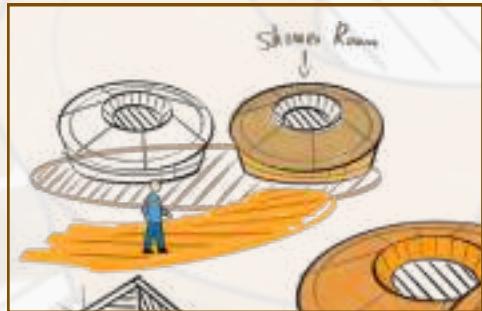

In the water room, they can **wash the food** or **filter the water** to drink

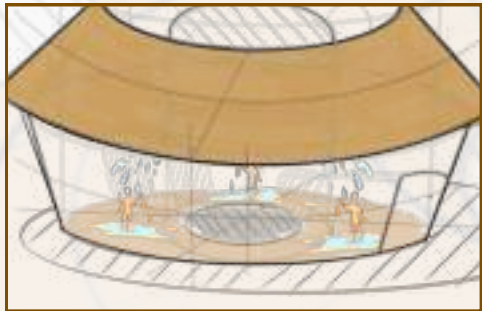

Then, they can take food handle well to **living room** and **cook** them to eat

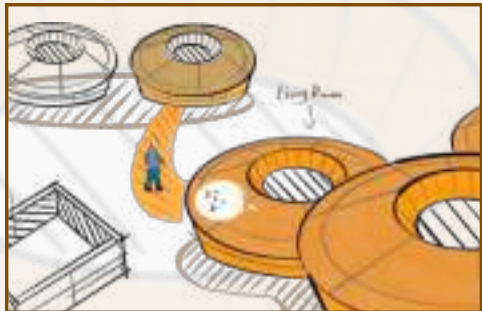

### Shower room

Shower room is for **cleaning bodies** as they lack of the cleaning management

As people having the meals or back home, they can go here to **take shower**

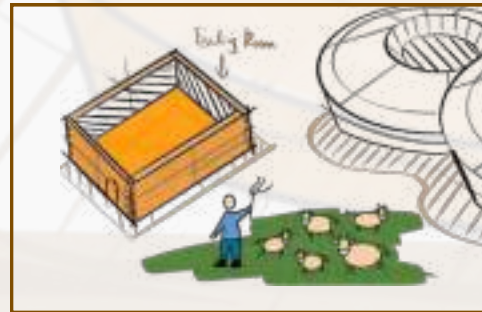

After that, they can do something **personally** or go home to **sleep**

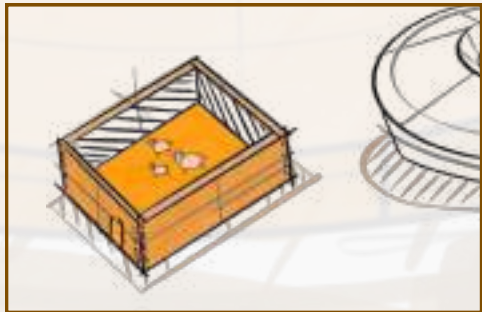

### Feeding room

Firstly, they may go to **hunt animals** or **lead their raised livestock** to graze

Feeding room provides a **concentration area** for livestock to live in

People **feed livestock** here and **classify the place** between people and animals
